Clinical Epidemiology
HSTD 30700
Course Instructors: Brian Chiu & Brandon Pierce
Offered: 2012-13; Summer: July 9-August 22; T/Th 9:00-11:00am
PQ: Introductory Statistics recommended, may be taken concurrently.
ID: CCTS 45100
Clinical epidemiology is the "application of epidemiologic principles and methods to problems encountered in clinical medicine." This course introduces the basic principles of epidemiologic study design, analysis and interpretation, with a particular focus on clinical applications. The course includes lectures and discussions based on critical appraisal of significant research articles. The course is primarily intended for, but not restricted to, students with prior clinical training. Health Studies 30700 and 30900 may not both be taken for credit, either will fulfill the basic epidemiology requirement for the MSCP in Health Studies and either will serve as the epidemiology prerequisite for Health Studies 31001.

Introduction to Biostatistics
HSTD 32100
Course Instructor: Jim Dignam
Offered: 2012-13; Summer: July 9-August 22; T/W/Th 3:00-4:30pm
PQ: 2 quarters of pre-calculus (Required course for MSCP and CRTP II)
ID: CCTS 45000
This course will provide an introduction to the basic concepts of statistics as applied to the bio-medical and public health sciences. Emphasis is on the use and interpretation of statistical tools for data analysis. Topics include (i) descriptive statistics; (ii) probability and sampling; (iii) the methods of statistical inference; and (iv) an introduction to linear and logistics regression.
*In addition to the course, there is a statistical computing workshop held on Wednesdays from 10-11:30am in BSIC 018.
DEPARTMENT OF HEALTH STUDIES COURSES

Autumn 2013

Principles of Epidemiology
HSTD 30900
Course Instructor: Ben Lahey
Offered: 2013-14; Autumn, T/Th 3-4:20pm
PQ: Introductory statistics recommended
ID: STAT 35000, PP HA 36400, ENST 27400; BIOS 29318
Epidemiology is the study of the distribution and determinants of health and disease in human populations. This course introduces the basic principles of epidemiologic study design, analysis, and interpretation, through lectures, assignments, and critical appraisal of both classic and contemporary research articles. The course objectives include: (1) To be able to critically read and understand epidemiologic studies; (2) To be able to calculate and interpret measures of disease occurrence and measures of disease-exposure associations; and (3) To understand the contributions of epidemiology to clinical research, medicine and public health.

Applied Regression Analysis
HSTD 32400
Course Instructor: Lin Chen
Offered: 2013-14; Autumn, T/Th 12:00-1:20pm
PQ: HSTD 32100; STAT 22000 or equivalent
ID: STAT 22400 (Primary)
This course is an introduction to the methods and applications of fitting and interpreting multiple regression models. The main emphasis is on the method of least squares. Topics include the examination of residuals, the transformation of data, strategies and criteria for the selection of a regression equation, the use of dummy variables, tests of fit. Stata computer package will be used extensively, but previous familiarity with Stata is not assumed. The techniques discussed will be illustrated by real examples involving biological and social science data.

Applied Survival Analysis
HSTD 33100
Course Instructor: Hongyuan Cao
Offered: 2013-14; Autumn, T/Th 10:30-11:50am
PQ: HSTD 32100; STAT 22000; or equivalent, and HSTD 32400/STAT 22400 or equivalent; or consent of instructor.
ID: STAT 35600
This course will provide an introduction to the principles and methods for the analysis of time-to-event data. This type of data occurs extensively in both observational and experimental biomedical and public health studies, as well as in industrial applications. While some theoretical statistical detail is given (at the level appropriate for a Master's student in statistics), the primary focus will be on data analysis. Problems will be motivated from an epidemiologic and clinical perspective, concentrating on the analysis of cohort data and time-to-event data from controlled clinical trials.

Applied Longitudinal Data Analysis
HSTD 33300
Course Instructor: Ron Thisted
Offered: 2013-14; Autumn, T/TH 9:00-10:20am
PQ: HSTD 32400/STAT 22400 or equivalent, and HSTD 32600/STAT 22600 or HSTD 32700/STAT 22700 or equivalent; or consent of instructor.
ID: STAT 36900
Longitudinal data consist of multiple measures over time on a sample of individuals. This type of data occurs extensively in both observational and experimental biomedical and public health studies, as well as in studies in sociology and applied economics. This course will provide an introduction to the principles and methods for the analysis of longitudinal data. Whereas some supporting statistical theory will be given, emphasis will be on data analysis and interpretation of models for longitudinal data. Problems will be motivated by applications in epidemiology, clinical medicine, health services research, and disease natural history studies.
DEPARTMENT OF HEALTH STUDIES COURSES

Winter 2014

Epidemiologic Methods
HSTD 31001
Course Instructor: Diane Lauderdale & Ron Thisted
Offered: 2013-14; Winter, T/Th 12:00-1:20pm
PQ: HSTD 30700 or HSTD 30900 and HSTD 32400/applied statistics courses through multivariate regression or consent of instructor
ID: STAT 35700

This course expands on the material presented in "Principles of Epidemiology," further exploring issues in the conduct of epidemiologic studies. The student will learn the application of both stratified and multivariate methods to the analysis of epidemiologic data. The final project will be to write the "specific aims" and "methods" sections of a research proposal on a topic of the student's choice.

Biostatistical Methods
HSTD 32700
Course Instructor: Hongyuan Cao
Offered: 2013-14; Winter, T/Th 10:30-11:50am
PQ: HSTD 32400/STAT 22400; or STAT 24500; or equivalent; or consent of instructor
ID: STAT 22700

This course is designed to provide students with tools for analyzing categorical, count and time-to-event data frequently encountered in medicine, public health and related biological and social sciences. The course will emphasize application of the methodology rather than statistical theory, including recognition of the appropriate methods, interpretation and presentation of results. Methods covered include: contingency table analysis, Kaplan-Meier survival analysis, Cox proportional-hazards survival analysis, logistic regression, Poisson regression.

The U.S. Health Care System
HSTD 35411
Course Instructor: Fabrice Smieliauskas
Offered: 2013-14; Winter, Day & Time - TBD
PQ:
ID: SSAD 47512 (Primary); PPHA 37510

This course is a comprehensive examination of many of the key components of the U.S. health care system and how they work, intended for students from a wide range of backgrounds. Among others, topics may include public and private health insurance, the uninsured, health reform, hospitals, physicians, health care quality and costs, health information technology, pharmaceuticals, medical devices and diagnostics, long-term care, mental health services, and comparisons with health systems in developed and emerging markets.
DEPARTMENT OF HEALTH STUDIES COURSES

Spring 2014

Genetic & Molecular Epidemiology
HSTD 31831
Course Instructor: Brandon Pierce
Offered: 2013-2014; Spring; T/Th 9:00-10:20am
PQ: An introductory course in genetics and an introductory course in (bio)statistics or epidemiology.
ID: This course is designed for students with research interests related to identifying and characterizing the role of genetic and molecular factors in human disease risk and prognosis. Students will be introduced to the key concepts and methodological issues encountered in epidemiological studies that utilize genetic and molecular data. This course will train students on the theoretical and practical aspects of study design and data generation, and also provide the relevant hands-on training for quality control, management, and analysis of large-scale genomic/molecular data. Students are expected to have taken prior coursework in genetics as well as introductory statistics and/or epidemiology.

Introduction to Clinical Trials
HSTD 32901
Course Instructor: James Dignam
Offered: 2013-2014; Spring, T/Th 3-4:20pm
PQ: HSTD 32100; STAT 22000; introductory statistics; or consent of instructor
ID: STAT 35201
This course will review major components of clinical trial conduct, including the formulation of clinical hypotheses and study endpoints, trial design, development of the research protocol, trial progress monitoring, analysis, and the summary and reporting of results. Other aspects of clinical trials to be discussed include ethical and regulatory issues in human subjects research, data quality control, meta-analytic overviews and consensus in treatment strategy resulting from clinical trials, and the broader impact of clinical trials on public health.

Statistical Applications
HSTD 33500
Course Instructor: Robert Gibbons
Offered: 2013-2014; Spring, T/R 1:30-2:50pm
PQ: HSTD 32700/STAT 22700 or STAT 34700 or consent of instructor.
ID: STAT 35800
This course provides a transition between statistical theory and practice. The course will cover statistical applications in medicine, mental health, environmental science, analytical chemistry, and public policy. Lectures are oriented around specific examples from a variety of content areas. Opportunities for the class to work on interesting applied problems presented by U of C faculty will be provided. Although an overview of relevant statistical theory will be presented, emphasis is on the development of statistical solutions to interesting applied problems.

Health Services Research Methods
HSTD 35100
Course Instructor: Tamara Konetzka
Offered: 2013-14; Spring, M/W 1:30-2:50pm
PQ: At least one course in linear regression and basic familiarity with STATA; or consent of instructor.
ID: PPHA 38010; SSAD 46300
The purpose of this course is to better acquaint students with the methodological issues of research design and data analysis widely used in empirical health services research. To deal with these methods, the course will use a combination of readings, lectures, problem sets (using STATA), and discussion of applications. The course assumes that students have had a prior course in statistics, including the use of linear regression methods.
The U.S. Healthcare System
HSTD 35411
Course Instructor: Fabrice Smieliauskas
Offered: 2012-13; Spring
PQ: GPHAP requirement: Non-GPHAP students with permission of instructor
ID: SSAD 47512 (Primary); PPHA 37510
This course is a comprehensive examination of many of the key components of the U.S. health care system and how they work, intended for students from a wide range of backgrounds. Among others, topics may include public and private health insurance, the uninsured, health reform, hospitals, physicians, health care quality and costs, health information technology, pharmaceuticals, medical devices and diagnostics, long-term care, mental health services, and comparisons with health systems in developed and emerging markets.

Economics of the U.S. Health Care System
HSTD 35420
Course Instructor: Rena Conti
Offered: 2013-14; Spring, T/Th 12-1:20pm
PQ: Consent of Instructor
Theory and evidence on the economics of US medical care. Particular focus on the causes and consequences of high and rising health expenditures; technological change and the specific role of institutions in current reform efforts. The course is targeted to MA and PhD level students in business, policy and related disciplines. The course format will be a mix of lectures and presentations by guest speakers. Grading will be based on class participation, performance on course assignments and a final project. Attendance in all seminars is required.

Advanced Epidemiologic Methods
HSTD 40500
Course Instructor: Dezheng Huo
Offered: 2013-2014; Spring, T/Th 10:30-11:50am
PQ: HSTD 31001
This course examines some features of study design, but is primarily focused on analytic issues encountered in epidemiologic research. The objective of this course is to enable students to conduct thoughtful analysis of epidemiologic and other population research data. Concepts and methods that will be covered include: matching, sampling, conditional logistic regression, survival analysis, ordinal and polytomous logistic regressions, multiple imputation, and screening and diagnostic test evaluation. The course follows in sequence the material presented in “Epidemiologic Methods.”
DEPARTMENT OF HEALTH STUDIES
COMPLETE LIST OF COURSES

Introduction to Global Health
HSTD 30030
Course Instructor: John Schneider
Offered: TBD
PQ: Open to advanced undergraduates and graduate students
ID: CCTS 43000 (Primary)
Introduction to Global Health provides an overview of global health from the historical perspective to the current state of global health. The course will feature weekly guest lecturers with a broad range of expertise in the field: topics will include the social and economic determinants of health, the economics of global health, global burden of disease, and globalization of health risks, as well as the importance of ethics, human rights and diplomacy in promoting a healthier world. Introduction to Global Health is designed for graduate-level students and senior undergraduates with an interest in global health work in resource-limited settings.

Clinical Epidemiology
HSTD 30700
Course Instructors: Brian Chiu & Brandon Pierce
Offered: Summer
PQ: Introductory Statistics recommended, may be taken concurrently.
ID: CCTS 45100
Clinical epidemiology is the “application of epidemiologic principles and methods to problems encountered in clinical medicine.” This course introduces the basic principles of epidemiologic study design, analysis and interpretation, with a particular focus on clinical applications. The course includes lectures and discussions based on critical appraisal of significant research articles. The course is primarily intended for, but not restricted to, students with prior clinical training. Health Studies 30700 and 30900 may not both be taken for credit, either will fulfill the basic epidemiology requirement for the MSCP in Health Studies and either will serve as the epidemiology prerequisite for Health Studies 31001.

Principles of Epidemiology
HSTD 30900
Course Instructor: Ben Lahey
Offered: Autumn
PQ: Introductory statistics recommended
ID: STAT 35000, PPHA 36400, ENST 27400; BIOS 29318
Epidemiology is the study of the distribution and determinants of health and disease in human populations. This course introduces the basic principles of epidemiologic study design, analysis, and interpretation, through lectures, assignments, and critical appraisal of both classic and contemporary research articles. The course objectives include: (1) To be able to critically read and understand epidemiologic studies; (2) To be able to calculate and interpret measures of disease occurrence and measures of disease-exposure associations; and (3) To understand the contributions of epidemiology to clinical research, medicine and public health.

Epidemiologic Methods
HSTD 31001
Course Instructor: Diane Lauderdale & Ron Thisted
Offered: Winter
PQ: HSTD 30700 or HSTD 30900 and HSTD 32400/applied statistics courses through multivariate regression or consent of instructor
ID: STAT 35700
This course expands on the material presented in “Principles of Epidemiology,” further exploring issues in the conduct of epidemiologic studies. The student will learn the application of both stratified and multivariate methods to the analysis of epidemiologic data. The final project will be to write the "specific aims" and "methods" sections of a research proposal on a topic of the student's choice.
Cancer Epidemiology
HSTD 31200
Course Instructor: Brian Chiu
Offered: Winter 2013 (Not offered every year)
PQ: HSTD 30700 or HSTD 30900
The purpose of this course is to review the basic concepts and issues relevant to cancer epidemiology. Specifically, this course will focus on interpreting cancer statistics, and describing the current state of knowledge regarding the etiology and risk factors for the major cancer sites. In addition, issues in research design and interpretation within the context of cancer epidemiology, as well as the molecular and cellular basis of carcinogenesis as it pertains to cancer occurrence in populations will be discussed. The course is appropriate for students who have an introductory knowledge of epidemiology. Previous study of cancer biology is helpful but not required.

Infectious disease epidemiology, networks and modeling
HSTD 31300
Course Instructor: Michael David & John Schneider
Offered: Spring 2013 (Not offered every year)
PQ: HSTD 30700 or 30900 or introductory epidemiology or consent of instructor
ID: CCTS 43200; BIOS 25419
This intermediate-level epidemiology course directed by two infectious disease epidemiologist-physicians will provide an up to date perspective on forgotten, contemporary and emerging infections. The course lectures and readings will provide a rigorous examination of the interactions among pathogens, hosts and the environment that produce disease in diverse populations. In addition to the demographic characteristics and the behaviors of individuals that are associated with a high risk of infection, we will examine complex aspects of the environment as they pertain to disease transmission. These include poverty, globalization, social networks, public health, and racial and ethnic disparities. Methodologic approaches to infectious disease epidemiology that will be covered include traditional study designs, molecular epidemiology, social network analysis, modeling, and network science. Local and global approaches will be applied to case studies from the United States, Asia and Africa.

Social Epidemiology
HSTD 31400
Course Instructor: Diane Lauderdale
Offered: TBD
PQ: A course in epidemiology, demography, medical sociology or the equivalent, and familiarity with multivariate statistical methods.
This course will examine research that has sought to understand how social factors influence health. We will survey and evaluate different types of measurements used in social epidemiology (such as measurements of socioeconomic status, race, ethnicity, stress, social support and neighborhood characteristics), types of study designs, and debates and theories in the literature. A prior course in epidemiology or closely related filed (such as demography or medical sociology) is highly desirable. Familiarity with the statistical methods used in the literature we will be reading, in particular multivariate regression analysis, is necessary.

Critical Readings in Epidemiology
HSTD 31510
Course Instructor: Epi Faculty
Offered: Spring (Not offered every year)
PQ: HSTD 30700 or HSTD 30900
Course consists of reading and critiquing important and innovative recent papers in epidemiology. Each week, there will be a different substantive or disease focus for the papers. Research areas covered will be primarily, but not exclusively, in noninfectious diseases. Different faculty will lead the discussion each week and students will prepare and present summary critiques of the articles.
Epidemiology of Mental Health
HSTD 31800
Course Instructor: Ben Lahey
Offered: TBD
The course will use a lecture format, but with some seminar elements. Most class time will be devoted to lecture and discussion, but each student will briefly present an overview of one significant article and lead the discussion of that paper. Students will be evaluated using a mid-term and a final written examination. Students may negotiate to replace one examination with a written paper under some circumstances.

Genetic & Molecular Epidemiology
HSTD 31831
Course Instructor: Brandon Pierce
Offered: Spring
PQ: An introductory course in genetics and an introductory course in (bio)statistics or epidemiology.
ID:
This course is designed for students with research interests related to identifying and characterizing the role of genetic and molecular factors in human disease risk and prognosis. Students will be introduced to the key concepts and methodological issues encountered in epidemiological studies that utilize genetic and molecular data. This course will train students on the theoretical and practical aspects of study design and data generation, and also provide the relevant hands-on training for quality control, management, and analysis of large-scale genomic/molecular data. Students are expected to have taken prior coursework in genetics as well as introductory statistics and/or epidemiology.

Introduction to Biostatistics
HSTD 32100
Course Instructor: Jim Dignam
Offered: Summer
PQ: 2 quarters of pre-calculus (Required course for MSCP)
ID: CCTS 45000
This course will provide an introduction to the basic concepts of statistics as applied to the bio-medical and public health sciences. Emphasis is on the use and interpretation of statistical tools for data analysis. Topics include (i) descriptive statistics; (ii) probability and sampling; (iii) the methods of statistical inference; and (iv) an introduction to linear and logistics regression.
*In addition to the course, there is a statistical computing workshop held on Wednesdays from 10-11:30am in BS LC 018.*

Applied Regression Analysis
HSTD 32400
Course Instructor: Lin Chen
Offered: Autumn
PQ: HSTD 32100; STAT 22000 or equivalent
ID: STAT 22400 (Primary)
This course is an introduction to the methods and applications of fitting and interpreting multiple regression models. The main emphasis is on the method of least squares. Topics include the examination of residuals, the transformation of data, strategies and criteria for the selection of a regression equation, the use of dummy variables, tests of fit. Stata computer package will be used extensively, but previous familiarity with Stata is not assumed. The techniques discussed will be illustrated by real examples involving biological and social science data.

Analysis of Categorical Data
HSTD 32600
Course Instructor: Mei Wang
Offered: Winter
PQ: HSTD 32100; STAT 22000; or consent of instructor.
ID: STAT 22600 (Primary)
The course is intended to provide students who already have some experience with linear regression with tools for analyzing data, which are largely categorical (rather than continuous measurements). Such data often arise in epidemiology, medicine, demography, sociology, and other social sciences. The course emphasizes good data analysis practice and use of appropriate statistical methods, rather than focusing on statistical theory.* A strong
emphasis is placed on both computational aspects of data analysis and on clear interpretation and presentation of results.
*Students interested in a more theoretical course should consider STAT 34700.

**Biostatistical Methods**
HSTD 32700  
Course Instructor: Hongyuan Cao  
Offered: Winter  
PQ: HSTD 32400/STAT 22400; or STAT 24500; or equivalent; or consent of instructor  
ID: STAT 22700  
This course is designed to provide students with tools for analyzing categorical, count and time-to-event data frequently encountered in medicine, public health and related biological and social sciences. The course will emphasize application of the methodology rather than statistical theory, including recognition of the appropriate methods, interpretation and presentation of results. Methods covered include: contingency table analysis, Kaplan-Meier survival analysis, Cox proportional-hazards survival analysis, logistic regression, Poisson regression.

**Introduction to Clinical Trials**
HSTD 32901  
Course Instructor: James Dignam  
Offered: Spring  
PQ: HSTD 32100; STAT 22000; introductory statistics; or consent of instructor  
ID: STAT 35201  
This course will review major components of clinical trial conduct, including the formulation of clinical hypotheses and study endpoints, trial design, development of the research protocol, trial progress monitoring, analysis, and the summary and reporting of results. Other aspects of clinical trials to be discussed include ethical and regulatory issues in human subjects research, data quality control, meta-analytic overviews and consensus in treatment strategy resulting from clinical trials, and the broader impact of clinical trials on public health.

**Applied Survival Analysis**
HSTD 33100  
Course Instructor: Hongyuan Cao  
Offered: Autumn  
PQ: HSTD 32100; STAT 22000; or equivalent, and HSTD 32400/STAT 22400 or equivalent; or consent of instructor.  
ID: STAT 35600  
This course will provide an introduction to the principles and methods for the analysis of time-to-event data. This type of data occurs extensively in both observational and experimental biomedical and public health studies, as well as in industrial applications. While some theoretical statistical detail is given (at the level appropriate for a Master's student in statistics), the primary focus will be on data analysis. Problems will be motivated from an epidemiologic and clinical perspective, concentrating on the analysis of cohort data and time-to-event data from controlled clinical trials.

**Applied Longitudinal Data Analysis**
HSTD 33300  
Course Instructor: Ron Thisted  
Offered: Autumn  
PQ: HSTD 32400/STAT 22400 or equivalent, and HSTD 32600/STAT 22600 or HSTD 32700/STAT 22700 or equivalent; or consent of instructor.  
ID: STAT 36900  
Longitudinal data consist of multiple measures over time on a sample of individuals. This type of data occurs extensively in both observational and experimental biomedical and public health studies, as well as in studies in sociology and applied economics. This course will provide an introduction to the principles and methods for the analysis of longitudinal data. Whereas some supporting statistical theory will be given, emphasis will be on data analysis and interpretation of models for longitudinal data. Problems will be motivated by applications in epidemiology, clinical medicine, health services research, and disease natural history studies.
Statistical Applications
HSTD 33500
Course Instructor: Robert Gibbons
Offered: Spring
PQ: HSTD 32700/STAT 22700 or STAT 34700 or consent of instructor.
ID: STAT 35800
This course provides a transition between statistical theory and practice. The course will cover statistical applications in medicine, mental health, environmental science, analytical chemistry, and public policy. Lectures are oriented around specific examples from a variety of content areas. Opportunities for the class to work on interesting applied problems presented by U of C faculty will be provided. Although an overview of relevant statistical theory will be presented, emphasis is on the development of statistical solutions to interesting applied problems.

Health Services Research Methods
HSTD 35100
Course Instructor: Tamara Konetzka
Offered: Spring
PQ: At least one course in linear regression and basic familiarity with STATA; or consent of instructor.
ID: PPHA 38010; SSAD 46300
The purpose of this course is to better acquaint students with the methodological issues of research design and data analysis widely used in empirical health services research. To deal with these methods, the course will use a combination of readings, lectures, problem sets (using STATA), and discussion of applications. The course assumes that students have had a prior course in statistics, including the use of linear regression methods.

Aging and Health Policy
HSTD 35301
Course Instructor: Tamara Konetzka
Offered: TBD
PQ: Graduate standing or consent of instructor.
ID: PPHA 42401; SSAD 49022
This course is a seminar in aging and health policy and the relationships between policy, financing, access to care, and quality of care for the elderly. The focus is on health care systems and policy as opposed to demography and biological aspects of aging. Specific topics include Medicaid and Medicare policy; long-term care insurance and financing; workforce issues; dementia and end-of-life care; the culture change movement; work and retirement as it relates to health policy; and cross-national comparisons of health policy toward the elderly. Students will engage in an ongoing discussion of policy options and learn to evaluate their potential to improve quality and ensure access for the elderly to health care and long-term care.

The U.S. Health Care System
HSTD 35411
Course Instructor: Fabrice Smeiauskas
Offered: Winter & Spring
PQ: GPHAP requirement in Spring quarter: Non-GPHAP students with permission of instructor
ID: SSAD 47512 (Primary); PPHA 37510
This course is a comprehensive examination of many of the key components of the U.S. health care system and how they work, intended for students from a wide range of backgrounds. Among others, topics may include public and private health insurance, the uninsured, health reform, hospitals, physicians, health care quality and costs, health information technology, pharmaceuticals, medical devices and diagnostics, long-term care, mental health services, and comparisons with health systems in developed and emerging markets.

Economics of the U.S. Health Care System
HSTD 35420
Course Instructor: Rena Conti
Offered: 2013-14; Spring
PQ: Consent of Instructor
Theory and evidence on the economics of US medical care. Particular focus on the causes and consequences of high and rising health expenditures; technological change and the specific role of institutions in current reform efforts. The
course is targeted to MA and PhD level students in business, policy and related disciplines. The course format will be a mix of lectures and presentations by guest speakers. Grading will be based on class participation, performance on course assignments and a final project. Attendance in all seminars is required.

Health Economics and Public Policy
HSTD 38300
Course Instructor: Tomas Philipson
Offered: TBD
PQ: Microeconomics at the level of the Econ 200-201 series or PPHA 323 & 324 or an equivalent of an intermediate microeconomics course and a working knowledge of calculus
ID: PPHA 38300 (Primary); ECON 27700
This course analyzes the economics of health and medical care in the United States with particular attention to the role of government. The first part of the course examines the demand for health and medical and the structure and the consequences of public and private insurance. The second part of the course examines the supply of medical care, including professional training, specialization and compensation, hospital competition, and finance and the determinants and consequences of technological change in medicine. The course concludes with an examination of recent proposals and initiatives for health care reform.

Advanced Topics in Health Economics
HSTD 38400
Course Instructor: Tamara Konetzka & Rena Conti
Offered: TBD
PQ: Graduate courses in microeconomics and econometrics or statistics, including the use of linear and nonlinear regression methods.
The purpose of this course is to provide substantial exposure to the state of the evidence and the major theoretical and empirical approaches used to study salient issues in health economics. Selected topics may vary from year to year; examples include health capital, health insurance, health behaviors, health care market structure and competition, not-for-profit ownership, payment incentives, and the effects of information on provider behavior (e.g. public reporting and value-based purchasing) and consumer behavior (e.g., advertising and medical decision making). The course is aimed at students who wish to pursue a career in, or related to, health economics. Students will be expected to read each paper in depth, participate in discussions about them, and present and discuss several papers during the quarter. The instructors will assume that students have had prior graduate courses in microeconomics and econometrics or statistics, including the use of linear and nonlinear regression methods.

Master's Readings in Health Studies
HSTD 39000
Course Instructor: Varies
Arrange course content and meeting times with instructor.

Master's Research in Health Studies
HSTD 39100
Course Instructor: Varies
Arrange course content and meeting times with instructor.

Advanced Epidemiologic Methods
HSTD 40500
Course Instructor: Dezheng Huo
Offered: Spring
PQ: HSTD 31001
This course examines some features of study design, but is primarily focused on analytic issues encountered in epidemiologic research. The objective of this course is to enable students to conduct thoughtful analysis of epidemiologic and other population research data. Concepts and methods that will be covered include: matching, sampling, conditional logistic regression, survival analysis, ordinal and polytomous logistic regressions, multiple imputation, and screening and diagnostic test evaluation. The course follows in sequence the material presented in “Epidemiologic Methods.”
Causal Inference  
HSTD 43201  
Course Instructor: Guanglei Hong  
Offered: TBD  
PQ: Intermediate statistics or equivalent.  
ID: CHDV 30102 (Primary)  
This course is designed for graduate students and advanced undergraduate students from social sciences, education, public policy, health studies, social service administration, and statistics who are involved in quantitative research and are interested in studying causality. The course begins by introducing the notion of counterfactual outcomes and various causal inference techniques that are comparatively new to most social scientists. A major emphasis will be placed on conceptualizing causal questions, comparing alternative research designs, and identifying the assumptions under which a causal effect can be estimated from non-experimental data. In addition to studying experimental, quasi-experimental, and non-experimental designs, students will become familiar with causal inference techniques suitable for evaluating binary treatments, concurrent multi-valued treatments, time-varying treatments, as well as moderated and mediated treatment effects in non-experimental data.

Policy Analysis Methods and Applications  
HSTD 45610  
Course Instructor: Harold Pollack  
Offered: Winter  
PQ:  
ID: SSAD 45600 (Primary); PPHA 40101  
This course examines the intellectual bases and analytic tools for the professional practice of policy analysis, with an emphasis on economic policy analysis in the form of cost-benefit analysis, decision analysis, and cost-effectiveness analysis. Many examples will be drawn from medicine and public health, which offer particularly clear application of the basic methods. However we will also draw upon examples and challenges from environmental policy, criminal justice, transportation, and welfare policy.

Topics to be covered will include cost-benefit analysis, decision analysis, quality of life and cost measurement, model development and parameter estimation, and cost-effectiveness methods. Students will have weekly problem sets and instruction in a computer lab that will provide them with hands on experience performing decision analysis and cost-effectiveness analyses. Students taking this course will be prepared to take Advanced Applications of Cost-Effectiveness Analysis, which provides doctoral-level training in this area.
